Standard Practice for Health Requirements Relating to Occupational Exposure to Respirable Crystalline Silica

This Draft Uganda Standard, DUS 1814:2017, is based on ASTM E1132 – 06, Standard Practice for Health Requirements Relating to Occupational Exposure to Respirable Crystalline Silica, Copyright ASTM International, 100 Barr Harbor Drive, West Conshohocken, PA 19428, USA, pursuant to license with ASTM International. © UNBS 2017
Compliance with this standard does not, of itself confer immunity from legal obligations

A Uganda Standard does not purport to include all necessary provisions of a contract. Users are responsible for its correct application
Foreword

Uganda National Bureau of Standards (UNBS) is a parastatal under the Ministry of Trade, Industry and Cooperatives established under Cap 327, of the Laws of Uganda, as amended. UNBS is mandated to co-ordinate the elaboration of standards and is
(a) a member of International Organisation for Standardisation (ISO) and
(b) a contact point for the WHO/FAO Codex Alimentarius Commission on Food Standards, and
(c) the National Enquiry Point on TBT Agreement of the World Trade Organisation (WTO).

The work of preparing Uganda Standards is carried out through Technical Committees. A Technical Committee is established to deliberate on standards in a given field or area and consists of key stakeholders including government, academia, consumer groups, private sector and other interested parties.

Draft Uganda Standards adopted by the Technical Committee are widely circulated to stakeholders and the general public for comments. The committee reviews the comments before recommending the draft standards for approval and declaration as Uganda Standards by the National Standards Council.

This standard was developed by the Management and Services Standards Technical Committee (UNBS/TC 10). Wherever the words, “ASTM Standard” appear, they should be replaced by “Uganda Standard.”
Designation: E1132 – 06

This Draft Uganda Standard, DUS 1814:2017, is based on ASTM E1132 – 06, Standard Practice for Health Requirements Relating to Occupational Exposure to Respirable Crystalline Silica, Copyright ASTM International, 100 Barr Harbor Drive, West Conshohocken, PA 19428, USA, pursuant to license with ASTM International.

Standard Practice for
Health Requirements Relating to Occupational Exposure to Respirable Crystalline Silica

This standard is issued under the fixed designation E1132; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

INTRODUCTION

Silicon dioxide (silica, SiO$_2$) is encountered in nature and industry in a wide variety of forms. These range from essentially anhydrous types with or without a very high degree of crystallinity, to highly hydroxylated or hydrated types which are amorphous by x-ray diffraction examination. Crystalline silica exists in a number of forms or polymorphs. The three major forms, quartz, cristobalite, and tridymite, pertain to this practice. Quartz (or alpha quartz) is the more common form encountered as airborne particulates. Two of the polymorphs, cristobalite and tridymite, are formed at elevated temperatures and are much less common in nature, but might be encountered in several occupations where silicas are fired (calcined) at high temperatures. These silica materials have a broad range of physical and chemical properties.

1. Scope

1.1 This practice covers a description of several actions that should be taken to reduce the risk of harmful occupational exposures to humans in environments containing respirable crystalline silica. This practice is intended for, but not limited to, industries regulated by the U.S. Mine Safety and Health Administration (MSHA) and the U.S. Occupational Safety and Health Administration (OSHA). A separate practice, designed for the unique conditions of the construction industry is under development. While this practice was not designed specifically for construction, it can be applied and may be beneficial, to the extent feasible and practical, pending adoption of a construction industry standard.

1.2 Nothing in this practice shall be interpreted as requiring any action that violates any statute or requirement of any federal, state, or other regulatory agency.

1.3 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use. It is the responsibility of the user to consult all material safety data sheets and labels pertaining to any hazardous materials used in this standard.

3. Significance and Use

3.1 These practices and criteria were developed for occupational exposures. They are intended to (a) protect against clinical disease from exposure to respirable crystalline silica, (b) be measurable by techniques that are valid, reproducible, and readily available, and (c) be attainable with existing technology and protective practices.

4. General Requirements

4.1 Occupational Exposure Limits (OEL):

4.1.1 Permissible Exposure Limit (PEL) established by U.S. Occupational Health and Safety Administration (OSHA) General Industry (see 29 CFR 1910.1000)—Workers shall not be exposed to respirable dust containing 1% or more quartz exceeding 10/([% quartz + 2] mg/m$^3$ as an 8-h time weighted average in any 8-h work shift of a 40-h work week or, for total dust (respirable plus non-respirable), 30/([% quartz + 2] mg/m$^3$). The PEL for respirable cristobalite and tridymite is one-half the value for quartz.

4.1.1.1 PEL (mg/m$^3$) (respirable fraction):

\[
10 \div \left[ \frac{\% \text{ quartz} + \% \text{ cristobalite} \times 2 + \% \text{ tridymite} \times 2 + 2}{2} \right]
\]

---

7 Available from National Institute for Occupational Safety and Health, Division of Physical Sciences and Engineering, 4676 Columbia Parkway, Cincinnati, OH 45226.

© UNBS 2017 – All rights reserved
4.1.1.2 PEL (mg/m$^3$) (total dust):

$$30 ÷ \left[ \% \text{ quartz} + (\% \text{ cristobalite} \times 2) + (\% \text{ tridymite} \times 2) + 2 \right]$$

4.1.2 PEL established by U.S. Mine Safety and Health Administration (MSHA) (non-coal) (see 30 CFR 56.5001)—Workers shall not be exposed to respirable dust containing 1 % or more quartz exceeding the PEL as determined for a time weighted 8-h workday and 40-h workweek based on the following formula: $\text{PEL} = 10/(\% \text{ quartz} + 2)$ mg/m$^3$. The PEL for respirable cristobalite and tridymite is one-half the value for quartz.

4.1.3 Examples of other OELs are provided in Appendix X2.

4.1.4 Employers shall determine the appropriate OEL for their operation, but in no case shall the OEL be less stringent than the applicable government limit.

4.2 Exposure Assessment and Monitoring:

4.2.1 Risk can be assessed qualitatively based on Material Safety Data Sheets (MSDS), prior information, likelihood of dust generation, proximity of airborne dust to workers, nature of the industrial process (example: wet work—low risk; dry work—higher risk), and location of workers (example: control room). Note that the absence of visible dust is not a guarantee of lack of risk.

4.2.2 Initial sampling of representative workers’ exposures shall be made to characterize the exposure and its variability, to determine compliance with standards given in 4.1, and to establish a baseline exposure level in all areas where workers are or may be exposed to silica. Initial task sampling would be not required for short duration or transient tasks, tasks where timely sampling results would not be available, representative concentrations are already known, and proven task protection is in place. Exposure sampling should be periodic, and should occur frequently enough that a significant and deleterious change in the contaminant generation process or the exposure controls is not permitted to go undetected. This is particularly true for areas or operations where conditions can change dramatically within a short span of time.

4.2.3 When sampling is conducted, workers with a high relative risk of dust exposure should be sampled first. Sampling should then progress toward those individuals with low exposure risk. High relative risk can be assigned to any area where the process involved may generate respirable crystalline silica particles and persons are potentially exposed for most or all of a work shift.

4.2.4 Employers shall sample occupational exposures of workers exposed to respirable crystalline silica and maintain records of such sampling.

4.2.5 For workers with regular exposure to high silica concentrations that are placed inside of supplied air respirators or ventilated enclosures, such as in sandblasting, sampling should be conducted inside of the control device to determine employee exposure. The sampling line shall not interfere with the fit of the respirator. Consultation with the respirator manufacturer may be necessary to achieve the above requirement.

4.2.6 In areas where overexposures are persistent, a written Exposure Control Plan shall be established to implement engineering, work practice, and administrative controls to reduce silica exposures to below the OEL, or other elected limit, whichever is lower, to the extent feasible. A root cause analysis should be conducted for all exposures in excess of the OEL that cannot be accounted for. Root cause analysis involves investigating cause(s) for the excessive exposure, providing remedies, and conducting follow-up sampling to document that exposures are below the OEL.

4.2.7 Sampling shall be done at a frequency that provides reliable information for determining an appropriate control strategy. Sampling information and recommended frequency is summarized in Table 1.

<tr>
<td>Condition</td>
</tr>
<tr>
<td>Qualitative assessment</td>
</tr>
<tr>
<td>Initial sampling</td>
</tr>
<tr>
<td>Sampling results are below one half the OEL</td>
</tr>
</tbody>
</table>
No OEL overexposures were found, but exposures exceed one half the OEL. These noted locations are to be included in a sampling plan. Noted job functions should be sampled at least annually with a goal of sampling each employee with that job function within a 3 year period.

OEL was exceeded and engineering, work practice, and administrative controls, or all three, are being applied to the work area to reduce exposures to below the OEL (see 4.2.6). Sampling to be conducted before and after the remedy to assess the results of silica reduction efforts. If high levels persist institute workplace controls and include in sampling plan until levels are below one half the OEL.

Process materials, process equipment, engineering controls, or any other changes that occur which would tend to increase worker exposures. Sampling to be conducted as soon as feasible to assess the effects of workplace changes on worker exposures.

Ventilated protective enclosures are used because work area exposures are presumed or known to exceed the OEL. Sample at least annually to ensure that worker exposures do not exceed one half the OEL.

Short duration (hours or less) silica dust generation operations such as drilling and cutting. Depend on workplace controls to reduce exposures. Sampling only provides historical data since the operation will have ended before sample analysis results are available.

Worker(s) or supervision express concerns that silica exposures have increased. Review and discuss concerns and sample as soon as necessary to determine exposures.

4.2.8 Because people have different work habits, sampling should be rotated among different employees performing the same task with a goal of sampling each individual at least once every three years or use statistical random sampling.

4.2.9 Measurement of worker occupational exposures shall be within the worker’s breathing zone and shall meet the criteria of this section. Such measurements should be representative of the worker’s customary activity and should be representative of workshift exposure. Area sampling may be used to characterize exposures and identify effective controls when appropriate to the circumstances.

4.2.10 Respirable dust samples are to be collected according to accepted methods. Refer to Test Method D4532 and see Appendix X1 for an example.

4.3 Observation of Exposure Monitoring:

4.3.1 Employee Observation—The employer shall provide affected employees or their designated representatives an opportunity to observe any monitoring of employee exposure to silica and provide an explanation of the sampling procedure.

4.3.2 Monitoring Procedures—Whenever observation of the monitoring of employee exposure to respirable crystalline silica requires entry into an area where the use of respirators, protective clothing, or equipment is required, the employer shall provide and ensure the use of such personal protective equipment and shall require compliance with all other applicable safety and health procedures.

4.3.3 Monitoring Results—Observers shall be entitled to:

4.3.3.1 Receive an explanation of the measurement and analytical procedures,

4.3.3.2 Observe all steps related to the monitoring of respirable crystalline silica performed at the place of exposure, and

4.3.3.3 Record the results obtained for any real-time instruments and/or obtain copies of printouts or downloadable data files from those instruments. They should also be entitled to receive copies of the results when returned by the laboratory and to obtain explanations if they have questions about the data.

4.4 Methods of Compliance:

4.4.1 The methods listed below are applicable where compliance is required because of personal exposures exceeding the
OEL or a company-adopted exposure limit.

**Note**—One half the exposure limit is frequently used by employers as a warning since excursions above the exposure limit are possible.

### 4.4.2 Engineering Controls:

- **4.4.2.1** Use of properly designed engineering controls is the most desirable approach for controlling dust from crystalline silica-containing materials.
- **4.4.2.2** Adequate ventilation or other dust suppression methods shall be provided to reduce respirable crystalline silica concentrations to below the OEL, where feasible.
- **4.4.2.3** Enclosed workstations, such as control booths and equipment cabs, designed for protection against respirable crystalline silica dust, shall be under positive pressure and provided with clean make-up air. Re-circulation of air is not preferred; however, properly designed and maintained re-circulation systems are acceptable. Re-circulated air inside enclosed workstations should be in accordance with NIOSH guidance.
- **4.4.2.4** Engineering design of equipment shall include, where feasible, provisions to reduce exposure of workers to respirable crystalline silica dust to the OEL or below. If ventilation systems are used, they shall be designed and maintained to prevent the accumulation and re-circulation of respirable crystalline silica dust in the working environment (see ANSI Z9.2). If wet suppression systems are used, spray nozzles and associated piping shall be maintained to ensure that adequate wetting agent is applied where needed to control respirable crystalline silica dust. If hand-held or stationary tools are cut, grind or drill silica containing materials they should be designed and/or used in a manner to reduce dust exposures.
- **4.4.2.5** All engineering controls shall be properly maintained and periodically evaluated and brought up to specifications, when needed.

### 4.4.3 Work Practices and Administrative Controls:

- **4.4.3.1** Workers should not work in areas of visible dust generated from respirable crystalline silica-containing materials without use of respiratory protection, unless proven task protection is in use or air sampling shows exposures less than the OEL.
- **4.4.3.2** To the extent feasible, dry sweeping shall not be used in work areas where employees could reasonably be expected to be exposed to respirable silica dust above the OEL.
- **4.4.3.3** Workers shall not use compressed air to blow respirable crystalline silica-containing materials from surfaces or clothing, unless the method has been approved by an appropriate Regulatory agency.
- **4.4.3.4** Employers shall instruct workers about specific work practices that minimize exposure to respirable crystalline silica. Workers will perform their work tasks in accordance with these instructions.
- **4.4.3.5** Workers shall practice good housekeeping practices to minimize the generation and accumulation of dust.
- **4.4.3.6** Workers shall utilize available means to reduce exposure to dust, including the use of respirators, control rooms or rest areas, ventilation systems, high efficiency particulate air (HEPA) vacuum cleaners or water spray, wet floor sweepers, and rotation of personnel to minimize individual exposure.

### 4.5 Respiratory Protection:

- **4.5.1** Respirators shall be required in work situations in which engineering and work practice controls are not sufficient to reduce exposures of employees to or below the applicable OEL or company adopted level. Where the use of personal respiratory protection is required under this practice, the employer shall establish and enforce a program to include the following elements of a respiratory protection program, as specified and detailed in 29 CFR 1910.134 and ANSI Z88.2, for exposed workers. Respirators must comply with the requirements contained herein.
- **4.5.2** When respirators are used by this practice, the employer shall select a respirator certified by NIOSH under the provisions of 42 CFR 84 that has an assigned protection factor (APF) greater than the hazard ratio (HR) as determined by air sampling and analysis. The HR is defined as the ratio of the ambient concentration to the exposure limit. The APF values are given in Table 2. All respirators must be approved for use against silica type dusts. Respirators must comply with requirements of ANSI Z88.2. See Table 2 for recommended respiratory protection.

</tr>
</tbody>
</table>

<sup>A</sup> Assigned protection factor (APF). The APF is the minimum anticipated level of protection provided by each type of respirator.

<sup>B</sup> Only NIOSH/MSHA approved equipment should be used. These recommendations are intended to protect workers from silicosis.

4.5.3 Employers shall perform respirator fit tests in accordance with ANSI Z88.2 at the time of initial fitting and at least annually, thereafter, for each worker wearing tight-fitting respirators. The tests shall be used to select respirators that provide the required protection.

4.5.4 The employer shall institute a respiratory protection program that includes: individual medical clearance for respirator usage, worker training in the use and limitations of respirators, routine air monitoring, and the inspection, cleaning, maintenance, selection, and proper storage of respirators. This training shall be done at first employment and annually as refresher training. Any respiratory protection must, at a minimum, meet the requirements of 29 CFR 1910.134 and ANSI Z88.2. Respirators should be used according to the manufacturer’s instructions.

4.5.4.1 Each potential respirator wearer will receive medical clearance prior to the issuance of a respirator and subsequent fit testing. Detailed guidance is provided at 29 CFR 1910.134. Medical clearance is the process to determine an individual’s psychological and medical functional-ability to wear a respirator.

4.6 Respiratory Medical Surveillance:

4.6.1 The employer shall institute a respiratory medical surveillance program for all workers who work in areas, for 120 days per year or more, where the TWA concentration of respirable crystalline silica dust exceeds the OEL (see 4.1) or a lower
company adopted OEL, or where such concentrations are anticipated.

4.6.2 All medical examinations and medical procedures as required under 4.6 are to be performed by or under the direction of a licensed physician, and are provided without cost to the worker.

4.6.3 The employer shall provide the required medical surveillance to the workers and at a reasonable time and place.

4.6.4 Persons who administer the pulmonary function testing shall demonstrate proficiency in spirometry using the American Thoracic Society “Standardization of Spirometry.”

4.6.5 Medical examinations shall be made prior to placement of new workers (as defined in 4.6.1), and no less than once every three years thereafter. These examinations shall include as a minimum:

4.6.5.1 Medical and occupational history to elicit information on respiratory symptoms, smoking history, and prior exposures to dust and agents affecting the respiratory system. See Fig. X1.4 for example.

4.6.5.2 A posterior-anterior (PA) chest roentgenogram on a film no less than 14 by 17 in. and no more than 16 by 17 in. at full inspiration. The roentgenogram shall be classified according to the 2000 Guidelines for the Use of ILO International Classification of Radiographs of Pneumoconioses by currently NIOSH certified “B” readers. NIOSH “B” readers are physicians that have demonstrated proficiency in the classification of roentgenograms according to the ILO system by successfully completing a practical examination.

4.6.5.3 A tuberculosis intradermal skin test using purified protein derivative for workers with roentgenographic evidence of silicosis who have not been tested.

4.6.5.4 Spirometry is an OPTIONAL component of this practice. There is currently no evidence that routine medical surveillance with spirometry is useful for early detection of silica-induced lung disease. Experience has shown that most abnormalities on screening spirometry are not due to work-related disorders. Smoking, non-occupational pulmonary disease, and other variables are more common causes of alterations in pulmonary function. Provided spirometry is conducted, pulmonary function measurements should include a determination of forced vital capacity (FVC), forced expiratory volume in 1 s (FEV₁), and forced expiratory volume in 1 s as a percentage of total forced vital capacity (FEV₁/FVC%) and should be obtained. Spirometry results should be compared with the 95th-percentile lower limit of normal (LLN) values (see Hankinson et al, *Am J. Respiratory Critical Care Med.*, 1999 Jan, 159(1), pp. 179-87). Technicians performing spirometry test shall have attended a NIOSH certified spirometry training course (DHHS, (NIOSH) Pub No. 2004-154c).

4.6.6 The employer shall provide the following information to the health care provider:

4.6.6.1 A copy of this practice with appendix,

4.6.6.2 A description of the affected worker's duties as they relate to the worker's exposure,

4.6.6.3 The worker's representative exposure level or anticipated exposure level to respirable crystalline silica,

4.6.6.4 A description of any personal protective and respiratory protective equipment used or to be used by the worker, and

4.6.6.5 Information from previous medical examinations of the affected worker that is not otherwise available to the health care provider.

4.6.7 The physician shall not reveal either in the written opinion, or in any other means of communication with the employer, findings, including laboratory results, or diagnoses unrelated to an employee's occupational exposure to crystalline silica.

4.6.7.1 The physician's opinion as to whether the worker has any detected medical conditions that would place the worker at an increased risk of material health impairment from exposure to respirable crystalline silica,

4.6.7.2 Any recommended limitations on the worker or upon the use of personal protective equipment such as clothing or respirators; for example, the fact that worker is medically or emotionally unable to wear a respirator,

4.6.7.3 A statement that the worker has been informed by the physician of the results of the medical examination and of any medical conditions resulting from respirable crystalline silica exposure that require further examination or treatment.

4.6.8 The medical provider shall provide the following information to the employee:

4.6.8.1 A copy of the results of the medical examination, to include results of x-rays, spirometry and other laboratory testing, and

4.6.8.2 Any abnormalities, whether occupational or non-occupational, with recommendations, if any, for medical followup.

4.6.9 The employer shall provide the employee with a copy of the physician's written opinion within 30 days from its receipt. Situations of serious incidental disease or findings shall be reported to the employee as soon as feasible.

4.7 Medical Protection:

4.7.1 Workers with profusion of opacities equal to or greater than 1/1 shall be evaluated at a frequency as determined by a physician qualified in pulmonary disease. Recommendations provided by the examining physician regarding placement of the worker in the workplace will be followed for affected workers.

4.7.2 Workers with profusion of opacities equal to or greater than 1/1 will be counseled by a physician or other person qualified in occupational safety and health, at least annually, about silicosis prevention, safe work practices, respiratory protection, personal habits, smoking cessation, and other items and areas that could contribute to the betterment of their respiratory health.
4.7.3 When silicosis is diagnosed, it should be considered a sentinel event and all aspects of exposure monitoring, engineering control, administrative control, and personal protection should be closely re-examined and improved, as necessary, to protect similarly exposed workers.

4.8 Worker Training and Education:

4.8.1 Training—The employer shall provide training for each worker exposed or potentially exposed to respirable crystalline silica dusts at any level of exposure, including supervisors. Training shall be provided at no cost to the worker.

4.8.2 Frequency—Training shall be provided as follows:

4.8.2.1 Annually for all current workers covered in 4.8.1,

4.8.2.2 Prior to the initial job assignment for new workers exposed to respirable crystalline silica dusts,

4.8.2.3 Whenever a worker is assigned to a new or unfamiliar task or operation involving respirable crystalline silica dust exposure, and

4.8.2.4 Whenever a worker demonstrates unsafe job performance which may result in increased respirable crystalline silica dust exposures.

4.8.3 Content—At a minimum, training shall consist of the following elements:

4.8.3.1 The content of this practice and its appendix,

4.8.3.2 The specific nature of operations which could result in exposures to respirable crystalline silica dust above the OEL,

4.8.3.3 An explanation of engineering, work practice, hygiene, administrative and personal protection equipment (PPE) controls used in each of the above operations to eliminate or reduce respirable crystalline silica dust exposures, and

4.8.3.4 The purpose and description of the exposure monitoring and medical surveillance programs and the medical protection program, including information concerning the following:

4.8.3.4.1 The purpose of silicosis diagnostic exam elements such as work histories, chest X-rays, lung function tests, and TB screening.

4.8.3.4.2 The adverse health effects associated with excessive exposures to respirable crystalline silica dusts including silicosis, tuberculosis, and the possible association with lung cancer, autoimmune disorders, chronic renal disease, and

4.8.3.4.3 The relationship between smoking and exposure to respirable crystalline silica dusts in producing silicosis.

4.8.3.5 The purpose, selection, fitting, use, cleaning, disinfection, inspection, repairs, storage, and limitations of respirators if they are used to supplement engineering, administrative, and work practice controls to reduce respirable crystalline silica dust exposures.

4.8.4 Competency—Prior to assignment to new or unfamiliar respirable crystalline silica dust-exposing tasks and operations, the employer shall ensure that workers demonstrate proficiency in the use of all applicable exposure control measures for that operation such as PPE, engineering, administrative, work practice, and hygiene controls.

4.8.5 Training Methods—The employer shall present all training required by 4.8 in a language and manner that the worker is able to understand.

4.8.6 Certification of Training—The employer shall verify that training required by 4.8 has been completed by preparing a written certification record. The written certification record shall contain the name or other identity of the worker trained, the date(s) of the training, and the signature of the person who conducted the training or the signature of the employer. The most recent training certification shall be maintained.

4.8.7 Access to Information and Training Materials—The employer shall, upon request by any worker or their designated representative, permit review of this standard practice and its appendix, and to obtain copies of materials relating to the employer's silica training, medical, respiratory protection, and exposure control plan programs. Silica training materials protected by copyright, including but not limited to CD-ROMs and videos, are excluded from this requirement. If commercial materials are maintained at the work site, employees or their designated representatives shall be given the opportunity to review these materials.

4.8.8 Information concerning silicosis and other aspects of crystalline silica are available from OSHA, MSHA, and NIOSH.

4.9 Warning Signs and Labels:

4.9.1 In areas where respirable crystalline silica concentrations in the atmosphere are likely to exceed the standard, appropriate warning signs compatible with OSHA's (29 CFR 1910.1200) or MSHA's (30 CFR 47) Hazard Communication standards or state/local regulations/ordinances shall be provided. Warning signs, barricades, or work practices should be employed to restrict access to unauthorized persons. The method must alert anyone entering an exposure area as to the hazards and what actions or precautions should be taken. Examples of warning signs (English and Spanish) are provided (see Appendix X3).

4.9.2 A suitable warning label, in addition to or in combination with labels required by other statutes, regulations or ordinances shall be affixed to containers used for shipping material having a crystalline silica content that is capable of release which exceeds 0.1 % by weight or volume.
4.10 Record Keeping:

4.10.1 The employer shall establish and maintain an accurate record of all medical and exposure monitoring required by this practice. These records shall include, as a minimum, the following:

4.10.2 Name, identification number, and job classification of each worker monitored for dust exposure. The exposure monitoring result, work location, and monitoring date for each worker monitored, and the method for determining other workers whose exposure the measurement is intended to represent, and their identities. For sampling, see 4.2.11.

4.10.2.1 The type of respiratory protection worn by each worker monitored, if any, and fit testing records.

4.10.2.2 Where relevant, environmental variables that may have affected the measurement of worker exposure for each worker measurement.

4.10.3 Medical evaluation results and records of all sampling schedules, including sampling methods, analytical methods, breathing zone, and work area respirable crystalline silica dust concentrations shall be kept for at least 40 years or for the duration of employment plus 20 years, whichever is longer.

4.10.3.1 Medical records to include medical histories, radiographic films and any pulmonary function results shall be maintained according to standards of confidentiality and kept for at least 40 years or for the duration of employment plus 20 years, whichever is longer.

4.10.4 Each worker shall have access to records of that worker’s occupational exposure and medical examination records and be able to make copies for their own use in accordance with regulatory provisions.

4.10.5 Employees will be informed of medical and sampling results within 30 days of receipt of this data, (also see 4.6.9). An acknowledgment record, signed by the employee, attesting to being so informed of his or her medical results, should be maintained along with medical records for at least 40 years or for the duration of employment plus 20 years, whichever is longer. Sampling history and medical records, with employee’s consent and in accordance with standards of confidentiality, will be forwarded to their next employment if this employment is known.

4.11 Evaluation of this Standard Practice:

4.11.1 Periodic review and evaluation of workplace respirable silica exposure and silica-related health and disease records shall be performed to determine the effectiveness of control measures.

5. Physical and Chemical Properties

5.1 The physical and chemical properties of the crystalline silica (quartz) dusts and its polymorphs, cristobalite and tridymite, that are the subject of this practice vary over ranges characteristic of purity and particle size distribution.

5.1.1 Crystalline silica or quartz (CAS No 14808-60-7):

6. Laboratory Analysis

6.1 General Requirements:

6.1.1 The concentration of respirable crystalline silica dust in the air sampled with a gravimetric personal sampler shall be determined by NIOSH Methods 7500 (XRD), 7602 (IR), 7601 (visible absorption spectrophotometry) or 7603 (IR). Breathing zone sampling shall be as required in the method using a cyclone separator and the required filter. The employer shall ensure that the methods used to perform exposure monitoring produce results that are accurate to a confidence level of 95 %, and are within plus or minus 25 % for airborne concentrations of respirable crystalline silica above the 8-h TWA OEL. See Appendix X1 for an sampling example.

Note 2—Each of the NIOSH methods include sections on applicability, interferences, accuracy, and evaluation. Generally, Method 7500 (XRD) is to be preferred, but recently there is increased use of Method 7602 (IR), particularly for coal mine dust samples. An advantage of Method 7500 is its ability to distinguish among quartz and cristobalite? and tridymite. Method 7601 does not distinguish among these three. Method 7602 (IR) can distinguish between quartz and cristobalite, but only at some loss of sensitivity. However, tridymite can be determined only in the absence of the other two polymorphs. Interferences should be considered when selecting an analytical method, especially when silicates are involved. To assist the laboratory in identifying interferences, information should be provided along with the sample concerning the potential presence of aluminum phosphate, feldspars, graphite, iron carbide, lead sulfate, micas, montmorillonite, potash, sillimanite, silver chloride, talc, and zircon.

7. Keywords

7.1 crystalline silica dust; cristobalite; dust; occupational exposure; permissible exposure limits; quartz dust; respirators; respiratory protection; tridymite

APPENDIXES
(Nonmandatory Information)

X1. RESPIRABLE SAMPLING TECHNIQUE

X1.1 Respirable Sampling—Respirable dust samples can be collected using a two-stage, 10-mm nylon cyclone size-selective sampler that meets American Conference of Governmental Industrial Hygienists (ACGIH) criteria. The cyclone assembly is connected to a two-piece 37-mm cassette containing a collecting medium that consists of a pre-weighed 37-mm, low-ashing polyvinyl chloride (PVC) filter with a 5.0-μm pore size. A battery-operated pump, calibrated to a flow rate of 1.7 L of air per minute, will be used as the vacuum or pump source. For each day of sampling, one blank (unused) filter or a number equal to approximately 10 % of the total number of filters, all of the same lot, submitted for analysis, whichever is greater, should be sent to the laboratory. Sampling duration should be sufficient for laboratory detection at one-half the PEL at 5 % crystalline silica.

GUIDE FOR EMPLOYEE NOTIFICATION
OF
DUST SAMPLING RESULTS

This document provides notification guidelines for informing employees of dust sampling results. Notification is primarily directed at personal sample results; those samples collected by both government regulators and the company or its designated agent.

You are encouraged to report ALL sample results to affected employees, especially those sample results that exceed the Permissible Exposure Limit. Notification should be accomplished within 15 calendar days following receipt of personal dust sampling results.

The following paragraph constitutes guidelines for notification:

“The results of your dust sampling for [date] showed a result of [XXXXX mg/m³]. The Exposure Limit is [XXXXX mg/m³] and therefore your exposure was in excess of [or within] this limit, resulting in [ ] percent exposure. During the sampling period, your activity log indicated that you were doing [work activity description]. The following actions [for excessive exposures] are being investigated to help reduce future exposures to yourself [list actions]. Continue to wear your respirator. [This statement applies if the exposure exceeds the Exposure Limit or the company required respirator use exposure value].”

For documentation purposes the above notification should be delivered orally and in writing.

FIG. X1.3 Employee Notification
# Respiratory System Medical and Work History

Respiratory occupational health screening examinations can only indicate the presence of a possible medical problem. Abnormal findings detected by screening must be confirmed and then referred for diagnostic studies to determine their relationship to occupational exposure and/or their true significance. An accurate and up-to-date medical and work history is an essential part of a health screening examination. Please answer the following questions as completely and frankly as you can. If you are uncertain of a response, write “don’t know” or “unsure”. Do not leave answers blank. Your answers will be held in strict confidence in your medical records and may be used in medical studies without public release of your name.

| Name __________________________ | Date of birth __________________________ |
| Social Security no. __________________________ | Home phone __________________________ |
| Company name __________________________ | __________________________ |
| Plant location __________________________ | __________________________ |
| Job title __________________________ | __________________________ |
| Physician’s name __________________________ | Physician’s phone __________________________ |
| Physician’s address __________________________ | __________________________ |
| City __________________________ | State __________________________ | Zip __________________________ |
| Your height: __________ feet __________ inches | __________________________ |
| Race (optional): □ White □ Black □ Hispanic □ Asian/Pacific □ Alaskan/Indian | __________________________ |

## Family History

Your family history plays a significant role in your medical health status. Please check the appropriate boxes to indicate if any member of your family has had any of the following conditions:

- **Respiratory problems, lung disorders:**
  - □ Father □ Mother □ Grandparent □ Brother/sister □ Children

- **Asthma, hay fever, allergies:**
  - □ Father □ Mother □ Grandparent □ Brother/sister □ Children

- **Emphysema or bronchitis:**
  - □ Father □ Mother □ Grandparent □ Brother/sister □ Children

- **Tuberculosis or consumption:**
  - □ Father □ Mother □ Grandparent □ Brother/sister □ Children

- **Lung or respiratory cancer:**
  - □ Father □ Mother □ Grandparent □ Brother/sister □ Children

- **Heart problems:**
  - □ Father □ Mother □ Grandparent □ Brother/sister □ Children

- **Collapsed lung:**
  - □ Father □ Mother □ Grandparent □ Brother/sister □ Children

---

FIG. X1.4 Respiratory System Medical and Work History
## Respiratory System Medical and Work History

### Personal History

How many colds have you had in the past year?
- □ 1–3
- □ 4 or more

Do you cough up sputum/phlegm?
- □ After getting up in the morning
- □ When lying down
- □ All day

What color is your sputum/phlegm?
- □ White or clear
- □ Yellow or green
- □ Bloody

Have you ever had asthma?
- □ Yes
- □ Yes (currently under treatment)
- □ Childhood only

Do you have:
- □ Chronic or dry cough not due to cigarettes or smoking
- □ Chronic or recurrent productive cough
- □ Blood being coughed up from chest or lungs
- □ Red, rusty, or foaming pink phlegm

Do you usually cough first thing in the morning (on getting up) in the winter?
- □ Yes
- □ No

Do you usually cough during the day—or at night—in the winter?
- □ During the day
- □ At night
- □ At work

Do you cough like this on most days (or nights) for as much as three months each year?
- □ Yes
- □ No

Do you usually bring up any phlegm from your chest during the day—or night—in the winter?
- □ Yes
- □ No

In the past three years have you had a period of (increased) cough and phlegm lasting for three weeks or more?
- □ Yes
- □ No

Have you had more than one such period?
- □ Yes
- □ No

Have you coughed up blood:
- □ In the past year
- □ Before the past year

Are you troubled by shortness of breath:
- □ When hurrying on level ground or walking up a short hill
- □ When walking on level ground with people your own age
- □ During exercise
- □ At work

Does your chest ever sound wheezing or whistling?
- □ During the day
- □ At night

Have you recently had attacks of shortness of breath with wheezing?
- □ Yes, at home
- □ Yes, at work

If so, is your breathing absolutely normal between attacks?
- □ Yes
- □ No

What weather conditions affect your chest?
- □ Fog
- □ Damp
- □ Cold
- □ Heat

Do you usually have a stuffy nose in the winter?
- □ Yes
- □ No

**FIG. X1.4 (continued)**
**Personal History (Continued)**

Do you usually have a stuffy nose in the summer?
- ☐ Yes  ☐ No

Do you have a stuffy nose for as much as three months each year?
- ☐ Yes  ☐ No

During the past three years, has any chest illness kept you from your usual activities for as much as a week?
- ☐ Yes  ☐ No

Did you bring up more phlegm than usual during any such illness?
- ☐ Yes  ☐ No

Have you ever had:
- ☐ Chest injury  ☐ Chest operation  ☐ Heart trouble  ☐ Bronchitis  ☐ Pneumonia
- ☐ Pleurisy  ☐ Pulmonary tuberculosis  ☐ Bronchial asthma  ☐ Emphysema  ☐ Bronchiectasis
- ☐ Collapsed lung  ☐ Black lung disease  ☐ Asbestos  ☐ Pneumoconiosis  ☐ Byssinosis
- ☐ Farmer’s lung  ☐ Other chest trouble

Smoking history:
- ☐ Never smoked  ☐ Ex-smoker  ☐ Present smoker—do not inhale
- ☐ Present smoker—inhale slightly  ☐ Present smoker—inhale moderately  ☐ Present smoker—inhale deeply

Type of smoker:
- ☐ Cigarettes only  ☐ Pipe only  ☐ Cigars only  ☐ Cigarettes, pipe and cigars  ☐ Cigars and pipe

If you are an ex-smoker, how much did you smoke per day?
- ☐ ½ pack  ☐ 1 pack  ☐ 1½ packs  ☐ 2 packs  ☐ More than 2 packs

Do you use smokeless tobacco?
- ☐ Snuff  ☐ Chewing tobacco

If you currently smoke, how much do you smoke per day (average, including weekends)?
- Cigarettes:  ☐ ½ pack  ☐ 1 pack  ☐ 1½ packs  ☐ 2 packs  ☐ More than 2 packs
- Cigars:  ☐ 1  ☐ 2-5  ☐ 6-10  ☐ 11 or more
- Pipe:  ☐ ½ oz.  ☐ 1 oz.  ☐ 2 oz.  ☐ More than 2 oz.

What age were you when you started smoking?
- _____ years

For how many years have you smoked?
- _____ years

Have you ever worked:
- ☐ In dusty places
- ☐ In a mill processing mined or quarried materials
- ☐ In a foundry
- ☐ In construction, insulation, or shipyard work
- ☐ With X-rays or radioactive substances
- ☐ In a coal mine
- ☐ In a potter
- ☐ In welding
- ☐ In a hard rock or uranium mine
- ☐ In a quarry, including sand
- ☐ In abrasive blasting/sand blasting
- ☐ With asbestos

**FIG. X1.4 (continued)**
Respiratory System Medical and Work History

Personal History (Continued)

Have you ever worked where you often or daily breathed any of the following materials? (Check all appropriate.)

☐ Coal dust ☐ Silica or blasting sand ☐ Asbestos dust ☐ Talc, dust, diatomaceous earth
☐ Insect or plant spray ☐ Metal fumes or dust ☐ Plastic or resin fumes ☐ Engine exhaust fumes
☐ Grain dust ☐ Wood dust ☐ Toxic or irritating gases ☐ Toluene diisocyanate
☐ Methyl isocyanate ☐ Other isocyanates ☐ Mold, spores, pollen, yeast, or fungi ☐ Lead

Do you have a fear of:
☐ Being in closed places ☐ Wearing a face mask or respirator

Have you ever been told by a physician not to wear a face mask:
☐ Yes ☐ No

Do you have a problem getting a face mask or respirator to fit properly because of:
☐ Facial configuration ☐ Facial hair

How often do you wear a respirator?
☐ 4-8 hours per day ☐ Less than 4 hours per day ☐ As needed ☐ For emergencies only

What are the conditions when you use a respirator?
☐ Normal ☐ Noisy ☐ Heavy physical work

Can you use a respirator comfortably?
☐ Yes ☐ No

Have you been trained in the proper use of a respirator?
☐ Yes ☐ No

Do you have any of the above following symptoms while at work?
☐ Coughing and wheezing ☐ Throat irritation ☐ Nose irritation ☐ Eye irritation

Do you have any of the above symptoms after work?
☐ At night ☐ On weekends

Have you ever been off work for a shift or longer after acute exposure to gases or fumes?
☐ Yes ☐ No

Comments

FIG. X1.4 (continued)
X2. TABLE OF OCCUPATIONAL EXPOSURE LIMIT VALUES

The following table shows the Occupational Exposure Limits (OEL) in mg/m³ for respirable quartz, cristobalite and tridymite in application to the United States, Europe and Australia. OELs are expressed as 8-h time weighted average exposure limits.

**TABLE X2.1 Table of Occupational Exposure Limit Values**

X3. WARNING SIGNS

---

[^2]: OEL is 5mg/m³ for dust with <5 % quartz and is 25 mg/m³/%Quartz for dust >5 % quartz. Q: quartz percentage.
HEALTH HAZARD WARNING
Avoid Breathing Excessive Dust

Breathing silica-containing dust for prolonged periods in the workplace can be hazardous to your health.

Read our Material Safety Data Sheet (MSDS) for more health and safety information.

MSDSs are available at (name and location of your site(s)).

FIG. X3.1 Health Hazard Warning Sign (English)
ADVERTENCIA DE PELIGRO PARA LA SALUD
Evite Respirar Polvo Excesivo

Respirar polvo que contenga silice por períodos prolongados en el lugar de trabajo puede ser peligroso para su salud.

Lea nuestra Hoja de Informacion de Seguridad de Materiales (MSDS) para más información sobre la salud y la seguridad.

MSDSs está disponible en (el nombre y la ubicación de su sitio).

FIG. X3.2 Health Hazard Warning Sign (Spanish)
ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org). Permission rights to photocopy the standard may also be secured from the ASTM website (www.astm.org/COPYRIGHT/).
Certification marking

Products that conform to Uganda standards may be marked with Uganda National Bureau of Standards (UNBS) Certification Mark shown in the figure below.

The use of the UNBS Certification Mark is governed by the Standards Act, and the Regulations made thereunder. This mark can be used only by those licensed under the certification mark scheme operated by the Uganda National Bureau of Standards and in conjunction with the relevant Uganda Standard. The presence of this mark on a product or in relation to a product is an assurance that the goods comply with the requirements of that standard under a system of supervision, control and testing in accordance with the certification mark scheme of the Uganda National Bureau of Standards. UNBS marked products are continually checked by UNBS for conformity to that standard.

Further particulars of the terms and conditions of licensing may be obtained from the Director, Uganda National Bureau of Standards.
